

Deploying Node.js Application with Docker and Eureka Service Registry on AWS EC2

Introduction

This comprehensive guide walks you through deploying a Node.js application using Docker containers and registering it with a Eureka service registry on an AWS EC2 instance. We'll delve into the advantages of Docker, Docker Compose (both for future reference and manual deployment understanding), AWS EC2, and Eureka. Detailed instructions with code snippets will equip you to replicate this setup.

Table of Contents

1. Why Docker?
2. Why Docker Compose? (Optional)
3. Why AWS EC2?
4. Why Eureka Service Registry?
5. Step-by-Step Deployment:
 - a. Setting Up AWS EC2 Instance
 - b. Building Docker Images and Pushing to Docker Hub (Done Locally)
 - c. Running Docker Containers on EC2
 - d. Registering Services with Eureka
6. Conclusion

1. Why Docker?

- Docker excels at packaging your application and its dependencies into a standalone unit called a container.
- These containers ensure consistent application behavior across various environments (development, testing, production), eliminating the "it works on my machine" problem.
- Docker simplifies deployment and enhances scalability as containers can be easily scaled up or down based on demand.

2. Why Docker Compose?

- While not used in this manual deployment, Docker Compose simplifies managing multi-container applications.
- It allows defining the services, networks, and volumes required for your application in a single YAML file (docker-compose.yml).
- With a single command (docker-compose up -d), you can spin up all services defined in the Compose file, streamlining deployments for complex microservices applications.

- Consider using Docker Compose for future deployments to automate service management.

3. Why AWS EC2?

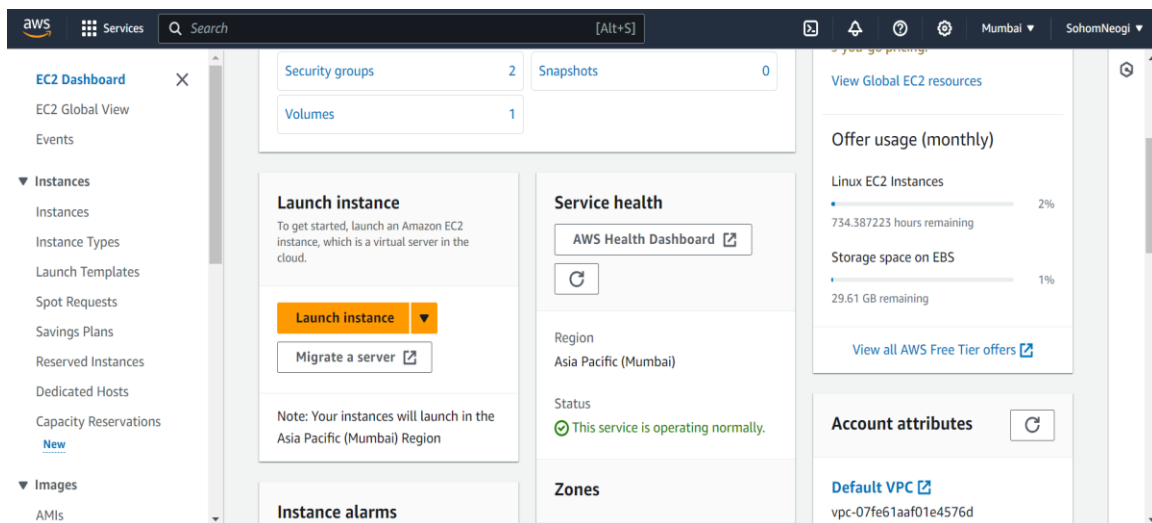

- AWS EC2 (Elastic Compute Cloud) provides scalable compute capacity in the cloud. We'll use EC2 instances to deploy Docker containers and run our Node.js applications. EC2 instances are secure, highly customizable, and scalable, making them ideal for hosting applications in the cloud.

4. Why Eureka Service Registry?

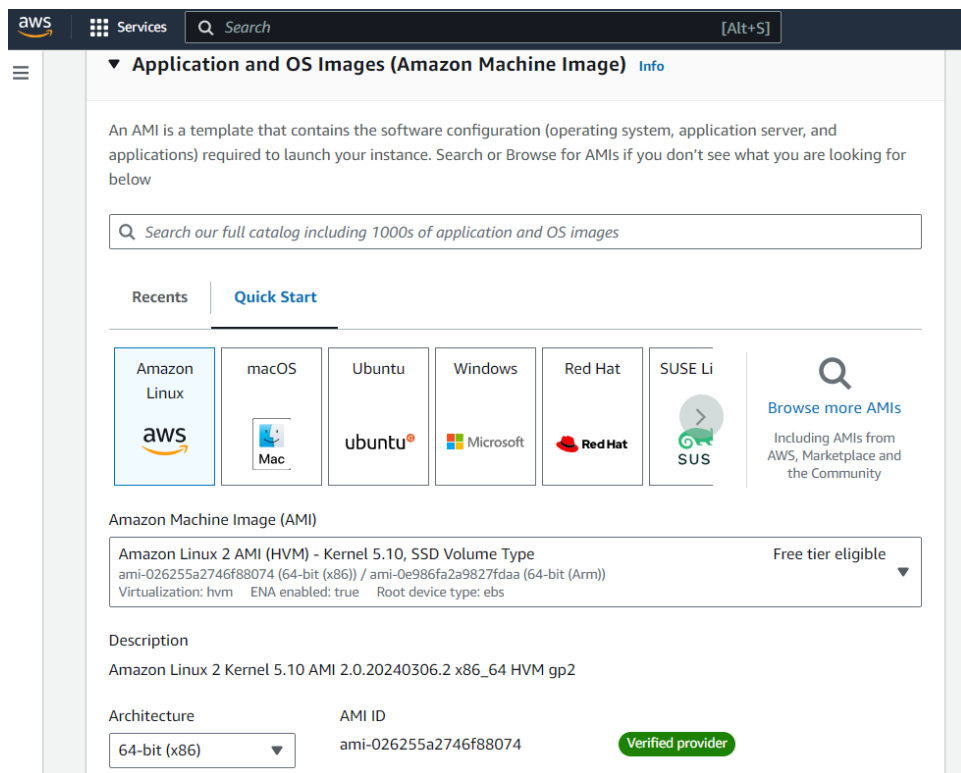

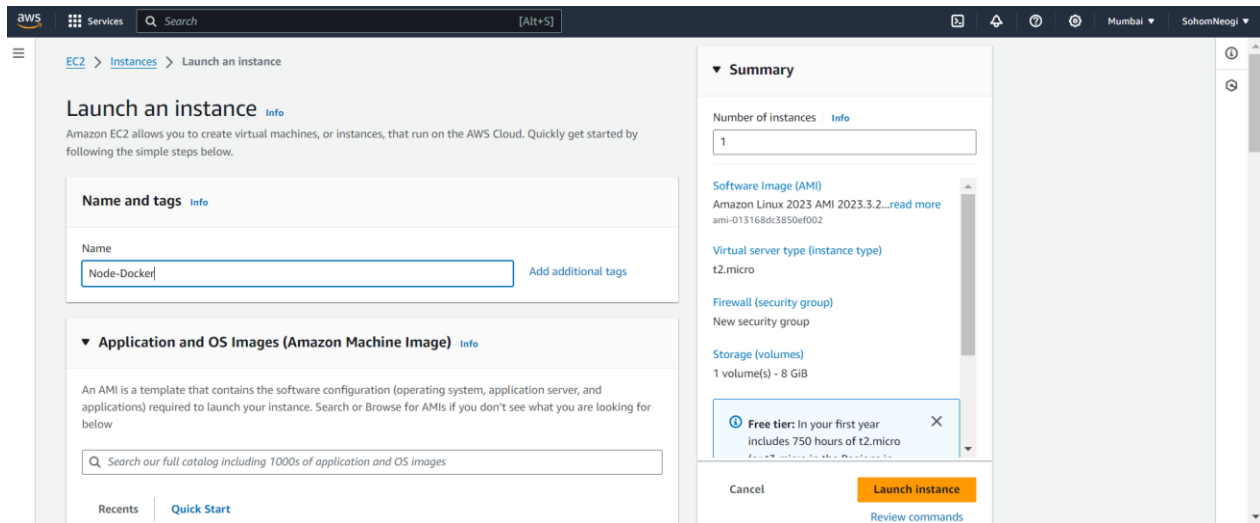

- Eureka, a service registry tool developed by Netflix, empowers microservices to register themselves and discover other services within the ecosystem. By registering services with Eureka, we achieve service discovery and load balancing. This ensures seamless communication between services, even as they scale up or down.

5. Step-by-Step Deployment:

- ◆ **Login to the AWS Management Console and navigate to EC2.**

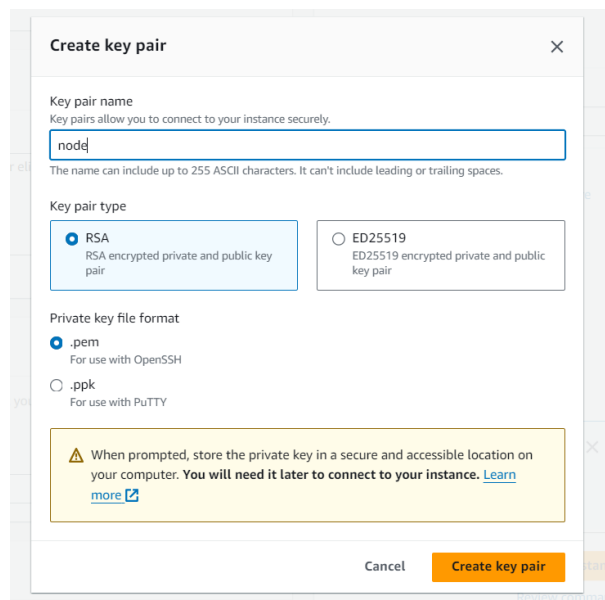

- ◆ Launch a new instance, providing a name and selecting an appropriate Application/OS image (e.g., Ubuntu, Amazon Linux 2).

- ◆ Choose an instance type (e.g., "t2.micro") based on your application's resource requirements.

- ◆ **Create a key pair and download the private key (.pem) file, storing it securely in your application directory.**

The screenshot shows the 'Create key pair' dialog box in AWS. It has a title bar with a close button (X). The main content area is divided into sections: 'Key pair name' with a text input field containing 'node' and a note about character limits; 'Key pair type' with two radio button options, 'RSA' (selected) and 'ED25519'; and 'Private key file format' with two radio button options, '.pem' (selected) and '.ppk'. At the bottom, there is a yellow warning box with a triangle icon and text about storing the private key. Below the warning box are 'Cancel' and 'Create key pair' buttons.

Create key pair [X]

Key pair name
Key pairs allow you to connect to your instance securely.
[node]
The name can include up to 255 ASCII characters. It can't include leading or trailing spaces.

Key pair type

☒ **RSA**
RSA encrypted private and public key pair

☐ **ED25519**
ED25519 encrypted private and public key pair

Private key file format

☒ **.pem**
For use with OpenSSH

☐ **.ppk**
For use with PuTTY

⚠ When prompted, store the private key in a secure and accessible location on your computer. **You will need it later to connect to your instance.** [Learn more](#)

Cancel **Create key pair**

- ◆ **Configure security groups to allow inbound traffic for ports used by your services (typically HTTP/HTTPS ports for Node.js applications).**

▼ Network settings [Info](#)

Edit

Network [Info](#)

vpc-07fe61aaf01e4576d

Subnet [Info](#)

No preference (Default subnet in any availability zone)

Auto-assign public IP [Info](#)

Enable

Additional charges apply when outside of free tier allowance

Firewall (security groups) [Info](#)

A security group is a set of firewall rules that control the traffic for your instance. Add rules to allow specific traffic to reach your instance.

☒ Create security group

☐ Select existing security group

We'll create a new security group called 'launch-wizard-2' with the following rules:

☒ Allow SSH traffic from

Helps you connect to your instance

Anywhere
0.0.0.0/0

☐ Allow HTTPS traffic from the internet

To set up an endpoint, for example when creating a web server

☐ Allow HTTP traffic from the internet

To set up an endpoint, for example when creating a web server

⚠ Rules with source of 0.0.0.0/0 allow all IP addresses to access your instance. We recommend setting security group rules to allow access from known IP addresses only.

×

- ◆ **After launching the instance, it would appear like this under the instances tab, wait for it until it's in the running state**

- ◆ **Connect to the instance using SSH Client**

- ◆ **Use your SSH client (e.g., Git Bash) and the downloaded private key file to connect to the instance using the following command, replacing placeholders with your actual details:**

- ◆ **Open git bash, redirect to your application directory**

- ◆ Copy the **ssh key** in your git bash (e.g - "**ssh -i "n_dc.pem...."**") for making connection to your instance

```

$ ssh -o "n_dc.pem" ec2-user@ec2-3-108-184-28.ap-south-1.compute.amazonaws.com
The authenticity of host 'ec2-3-108-184-28.ap-south-1.compute.amazonaws.com (3.108.184.28)' can't be established.
ED25519 key fingerprint is SHA256:YII60S5neEjMqAoIW8LYJiv4MnTmTrNC5PhcJlV3DBc.
This host key is known by the following other names/addresses:
  ~/.ssh/kknown_hosts:8: ec2-43-204-22-12.ap-south-1.compute.amazonaws.com
  ~/.ssh/kknown_hosts:10: ec2-52-66-49-230.ap-south-1.compute.amazonaws.com
  ~/.ssh/kknown_hosts:11: ec2-52-66-130-250.ap-south-1.compute.amazonaws.com
  ~/.ssh/kknown_hosts:12: ec2-65-2-148-212.ap-south-1.compute.amazonaws.com
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'ec2-3-108-184-28.ap-south-1.compute.amazonaws.com' (ED25519) to the list of known hosts.

A newer version of Amazon Linux is available!

Amazon Linux 2023, GA and supported until 2028-03-15.
https://aws.amazon.com/linux/amazon-linux-2023/

```

- ◆ **Install Docker and on the EC2 instance and start the server with admin permission**
 - Install docker on EC2 - `sudo yum install docker`
 - Start docker service - `sudo service docker start`

- Give admin permission to user - `sudo usermod -aG ec2 -user`
- Reinstall docker again - `sudo yum install docker`
- Reboot the system - `sudo reboot`
- Use this again to reconnect to the instance - `ssh -i "n_dc.pem" ec2-user@ec2-52-66-130-250.ap-south-1.compute.amazonaws.com`
- This hostname is subject to change on restarting the instance everytime (update it accordingly) `-52-66-130-250`
- Restart the docker service - `sudo service docker start`
- To see docker container/image information or to check whether docker has installed properly or not – `docker info`
- Build docker image of your applications in your local system
 - First create a DockerFile in your app directory

```
1 FROM node:16-alpine
2 WORKDIR /app
3 COPY package.json .
4 RUN npm install
5 COPY . .
6 EXPOSE 8000
7 ENV NODE_ENV=development
8 CMD ["npm", "run", "dev"]
9
```

- Build an image of the docker file in your local machine terminal – `docker image build -t <dockerHub_username>/<app-name>:<version_number> -f <file_name> .`
- Push the latest changes into dockerHub - `docker push <dockerHub_username>/<app-name>:<version_number>`
- Since my application is NodeJS application I have pulled an already set up image of an **Eureka Server** - `docker pull steeltocoss/eureka-server`
- Run the pulled **Eureka Server** image in EC2 instance - `docker run -d -p 8761:8761 steeltocoss/eureka-server`
- Pull your latest updated **service/services** from DockerHub that you've pushed from your local machine into the EC2 instance – `docker pull <dockerHub_username>/<app-name>:<version_number>`
- Run the **service/services** – `docker run -d -p PORT: PORT --name <any-name> <dockerHub-username>/<app-name>`

- To check for running containers (Eureka Server & Service 1) – **docker ps**

```
[ec2-user@ip-172-31-45-192 ~]$ docker run -d -p 8761:8761 --name e1 steeltoeoss/eureka-server
51f0d84b1da61065bd9b5de8f27d7edc4203fae09fdb7b437b25973198304125
[ec2-user@ip-172-31-45-192 ~]$ docker run -d -p 8000:8000 --name s1 sohom179/demo-app:1.0.0
795649e17f27c9daa7c021a31c0127239444fab44871e3ed46ac9caa14040073
[ec2-user@ip-172-31-45-192 ~]$ docker run -d -p 5001:5000 --name s2 sohom179/demo-service2:1.0.0
5dfa15ffe28293104ef9c1d6cba1d5d41149af6cc334a23b12c7843aaae9a968
[ec2-user@ip-172-31-45-192 ~]$ docker ps
```

CONTAINER ID	IMAGE	COMMAND	CREATED
5dfa15ffe282	sohom179/demo-service2:1.0.0	"docker-entrypoint.s..."	4 seconds ago
795649e17f27	sohom179/demo-app:1.0.0	"docker-entrypoint.s..."	10 seconds ago
51f0d84b1da6	steeltoeoss/eureka-server	"java -Djava.securit..."	18 seconds ago

```
[ec2-user@ip-172-31-45-192 ~]$
```

- Now, install a npm package **"npm i eureka-js-client"** into your node application and create a file **"eureka-client.js"** in your current Node application to make connection to the Eureka Server possible

```

1  const Eureka = require("eureka-js-client").Eureka;
2
3  const client = new Eureka({
4    // application instance information
5    instance: {
6      app: "nodedev",
7      hostName: "3.108.184.28",
8      ipAddr: "3.108.184.28",
9      port: {
10       $: 8000,
11       "@enabled": "true",
12     },
13     vipAddress: "nodedev",
14     statusPageUrl: "http://3.108.184.28:8000",
15     healthCheckUrl: "http://3.108.184.28:8000/health",
16     dataCenterInfo: {
17       "@class": "com.netflix.appinfo.InstanceInfo$DefaultDataCenterInfo",
18       name: "MyOwn",
19     },
20   },
21   eureka: {
22     // eureka server host / port / serviceUrls
23     host: "3.108.184.28",
24     port: 8761,
25     servicePath: "/eureka/apps/",
26   },
27 });
28
29 client.start();
30
31 client.on("error", (error) => {
32   console.error("Error with Eureka client", error);
33 });
34

```

- Stop the current service – `docker container stop <container_id>/<name>`

```

[ec2-user@ip-172-31-45-192 ~]$ docker stop e1
e1
[ec2-user@ip-172-31-45-192 ~]$ docker stop s1
s1
[ec2-user@ip-172-31-45-192 ~]$ docker stop s2
s2
[ec2-user@ip-172-31-45-192 ~]$ |

```

- **Rebuild** the image, **push** the latest build from your local machine and **pull** the updated service into your EC2 instance and **re-run** it with the above commands

- Remove any stopped/unused containers or dangling images (images with version number as <none> which gets created while rebuilding an application) so that no name clash or port mismatch occurs – **docker system prune**

```
[ec2-user@ip-172-31-45-192 ~]$ docker system prune
WARNING! This will remove:
- all stopped containers
- all networks not used by at least one container
- all dangling images
- all dangling build cache

Are you sure you want to continue? [y/N] y

```

- After service 1 registers with Eureka, you should be able to see it listed in the Eureka server UI. Access the Eureka server UI by navigating to http://<EC2_instance_public_DNS>:8761/ in your browser.
- You should see your service listed under "Applications."

- From there you can redirect to your service url to check whether your services are working properly or not and whether they are getting registered/communicating

Conclusion

This documentation has guided you through deploying a Node.js application using Docker containers on AWS EC2 and registering it with a Eureka service registry. By leveraging Docker, AWS EC2, and Eureka, we've achieved a scalable and resilient architecture for your microservices-based application. This setup ensures seamless communication between services and facilitates easy deployment and management.
